

Software Packaging with Open Build Service

Now a Hit Motion Picture Available on VHS

Craig Gardner
Technical Training Architect
cgardner@suse.com

Software Engineering Manager
lvogdt@suse.com

Agenda

- **Packaging is Important!**
- **Review RPM Packaging Basics**
- **Intermediate RPM Package Management for SUSE**
- **SUSE Packaging in Open Build Service**
- **Support for Other Packaging Paradigms in Open Build Service**
- **Lots of Hands On Along the Way**

Why Packaging Is Critically Important

Critically Important

- **Delivery of software to customers and users**
- **Reproducibility and Consistency**
- **Upgradeability and Uninstallability**
- **Tracking / Auditing / Monitoring**

Packaging Makes Your Solution Universal

Want to make your software truly useful?

Package It!

Packaging streamlines the delivery of your software

Review of RPM Basics

RPM Metadata

- **Version tracking**
- **Manifest of files**
- **Descriptive data**
- **Rules for:**
 - Installing
 - Updating
 - Uninstalling
- **Dependencies**

```
Name       : glibc
Version    : 2.19
Release    : 38.2
Architecture: x86_64
Install Date: Tue Jul  5 20:00:15 2016
Group      : System/Libraries
Size       : 6658417
License    : LGPL-2.1+ and SUSE-LGPL-2.1+-with-GCC-exception and GPL-2.0+
Signature  : RSA/SHA256, Mon Jun 27 16:26:05 2016, Key ID 70af9e8139db7c82
Source RPM : glibc-2.19-38.2.src.rpm
Build Date : Mon Jun 27 16:07:38 2016
Build Host : sheep23
Relocations : (not relocatable)
Packager   : https://www.suse.com/
Vendor     : SUSE LLC <https://www.suse.com/>
URL        : http://www.gnu.org/software/libc/libc.html
Summary    : Standard Shared Libraries (from the GNU C Library)
Description :
The GNU C Library provides the most important standard libraries used
by nearly all programs: the standard C library, the standard math
library, and the POSIX thread library. A system is not functional
without these libraries.
Distribution: SUSE Linux Enterprise 12
```

RPM Packaging Fundamentals

- **“package”**
 - Normal .rpm file (that contains the payload of software and metadata)
 - The set of files necessary to build the software
- **RPM Database**
- **rpm**
- **rpmbuild**
 - Builds software from sources
 - Builds for a specific architecture
 - Creates a versioned binary package for installation/upgrade
 - cpio archive of files + scriptlets

A Little Hands On

Intermediate Package Management

Intermediate Packaging Concepts

- **Source Patches**
 - Quilt <https://goo.gl/dA6JQM>
- **Macros**
- **Scriptlets**
- **Library Packages and Subpackages**
- **Dependencies, capabilities, renaming, prerequisites, etc.**
- **What about Epoch? (It's generally "a bad thing (tm).")**
- **What about triggers? (Why you should try to avoid them.)**
- **Package Hub 15**
 - XXX Y:00 PM Ismail Dönmez

Scriptlets

Examine specfile

`%pre, %preun`

`%post, %postun`

Differentiating between initial install and upgrade

`%pre`

`if [$1 -gt 1] ; then`

`fi`

Scriptlets

Helpful table

(see: https://en.opensuse.org/openSUSE:Packaging_scriptlet_snippets)

	Install	Upgrade	Uninstall
%pre	\$1 == 1	\$1 == 2	n/a
%post	\$1 == 1	\$1 == 2	n/a
%preun	n/a	\$1 == 1	\$1 == 0
%postun	n/a	\$1 == 1	\$1 == 0

Macros/Variables

See `/usr/lib/rpm/macros`
`/usr/lib/rpm/suse_macros`

Library Packages and Subpackages

Examine specfile

%package -n

%description -n

%scriptlets (%post, %pre, etc)

%files -n

Dependencies and Capabilities

Examine specfile

Requires and BuildRequires

PreReq

Provides

Obsoletes

Epoch

Good or bad? A common example:

- **perl version 5.00503**
- **Perl version 5.6**
- **5.6 ?> 5.00503**

Epoch to the rescue!

But does epoch really save you?

Triggers

- **Tread carefully – rare cases**
- **Often have unintended effects**
- **Better left to distro maintainers**
 - Not likely to have the intended effect for stand-alone application packages
 - Certainly “ok” for something like an independent appliance

Advanced Package Management

Advanced OBS Concepts

- **Source Services**
- **Building Other Stuff**
 - Packages for other distros
 - Images
 - JEOS, KVM, XEN, VirtualBox®, VMWare®, Live Distros, Appliances, etc.
- **Containers**
 - For CaaS Platform (Docker, Kube, etc.)
 - SUSE Container Registry

If we had more time...

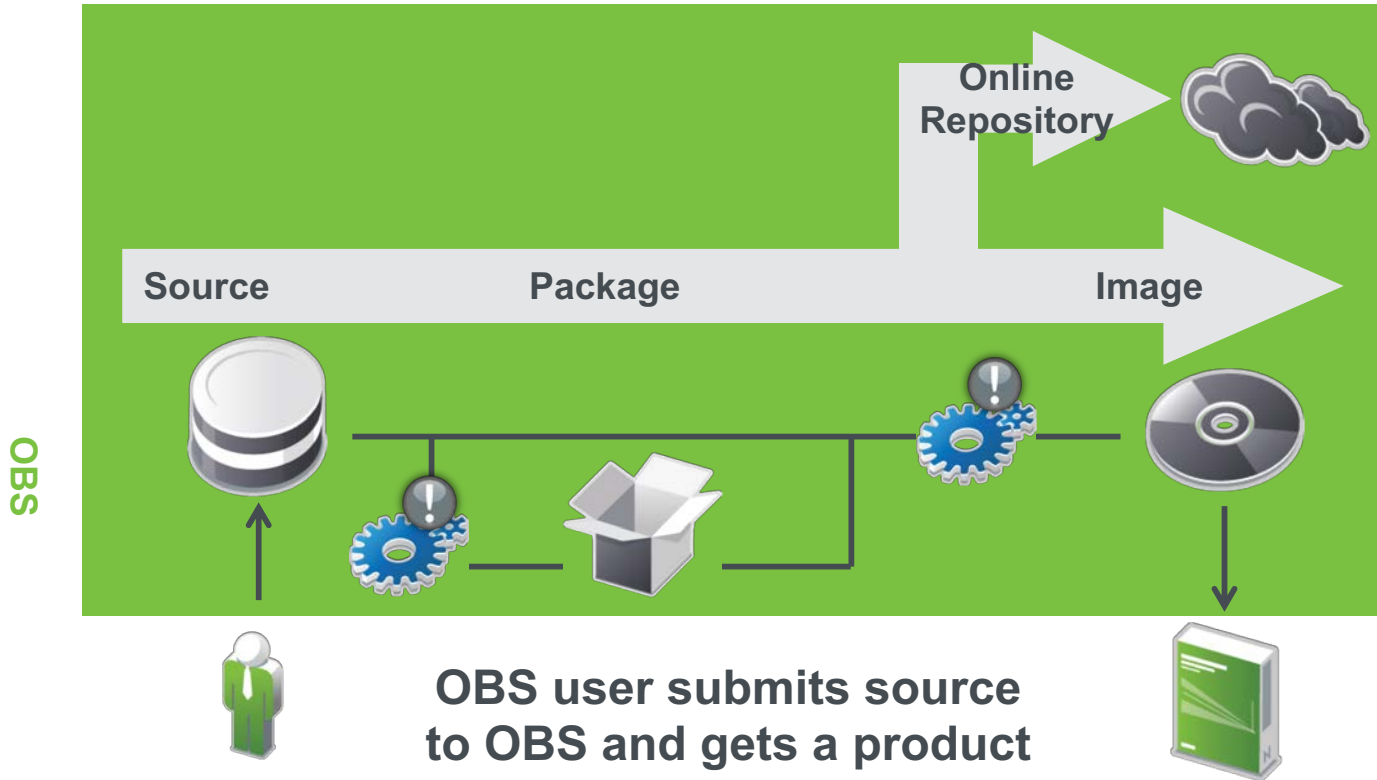

More Hands On Demonstration

Open Build Service

Build Service Basics

- **Builds Everything SUSE (and openSUSE)**
- **Builds on all supported architectures**
- **Builds for all current distributions (and, optionally, older ones)**
- **Builds from sources, outputs installable packages**
 - Also builds ISOs and other stuff mentioned earlier
- **Available for you to do your builds**
 - Use our Build Service
 - It's open source: deploy and use your own Build Service

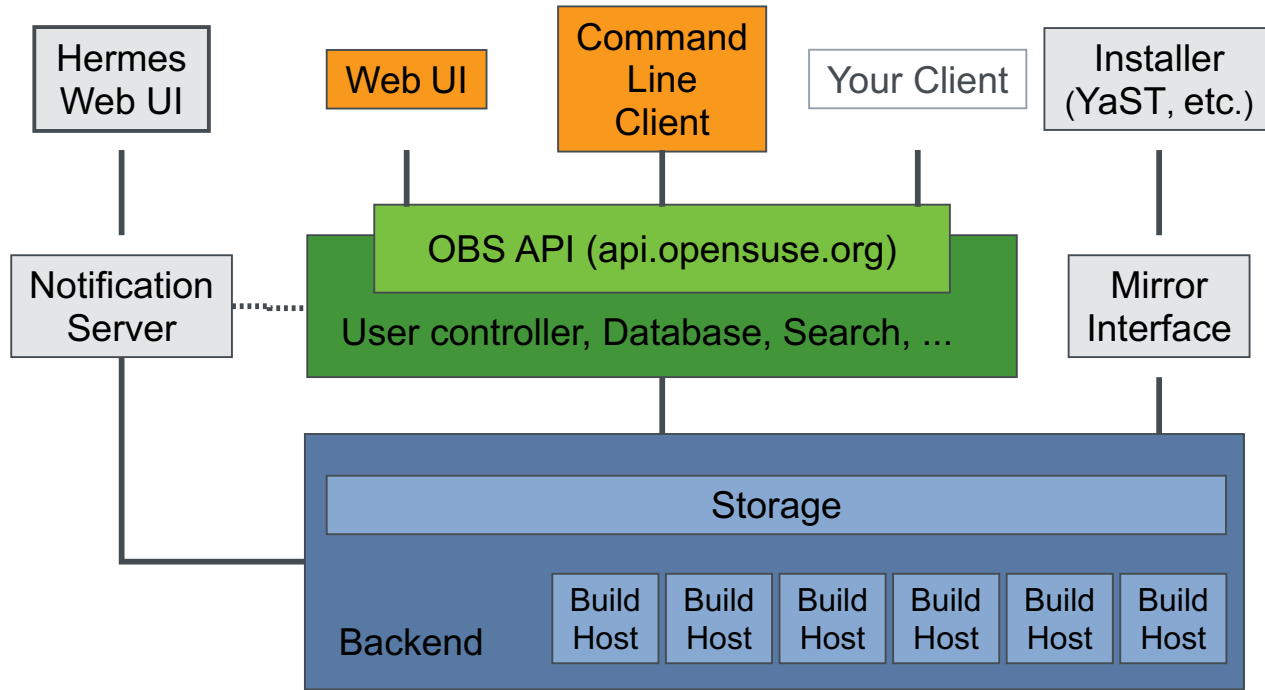

What Is Open Build Service (OBS)?

Components of Open Build Service

- **A Server that:**
 - Stores all source in a revision control system
 - Stores all built binaries
 - Calculates the need to rebuild packages
 - Acts as a database for various queries
- **A Set of Client Tools, API:**
 - “osc” command line interface
 - Optimized for handling sources
 - Run builds on your local machine the same as you would do on the server
 - Web UI
 - Optimized to see current status
 - Manage requests for changes

Server-side Components

Other Distros in Open Build Service

Build for Other Distributions

- **RedHat / Fedora**

- RPM based, so (generally) use the same specfile
- Macros for accommodating distribution differences

- **Debian / Ubuntu**

- Packagename.dsc, debian.rules, and debian.control files
- Debian.changelog file
- http://en.opensuse.org/openSUSE:Build_Service_Debian_builds

Hands On with OBS

cp buildinfo/_build* .

**osc build \
--local-build \
--alternative-project=openSUSE:Leap:15.1 \
standard**
