# TRANSIENT ANALYSIS IN DISCRETE TIME OF MARKOVIAN QUEUES WITH QUADRATIC RATES

R.B. Lenin, P.R. Parthasarathy

Abstract. Transient system size probabilities in discrete time are obtained in exact closed form for queueing models with constant, linear and quadratic arrival and service rates. This is achieved by using some interesting identities of tridiagonal determinants. Equilibrium probabilities are derived.

**1991 A.M.S. (MOS) Subject Classification Codes.** 60K25,60J80,60J10,39A10

**Key words and phrases.** Eigenvalues, tridiagonal determinants, relaxation time, transient system size probabilities
